TRACE System Demo Guide

Final defense presenter sequence and speaking guide

Demonstrate one document request from student submission to release, then explain Admin oversight. Keep the same tracking number visible at every desk. “You” means the presenter assigned Student and Finance; Ed handles Window 1 and Jumiah handles College Secretary.

Suggested 20 minute sequence

Demonstration	Presenter	Minutes
Opening and purpose	You	1
Student request	You	2.5
Window 1 intake	Ed	2
Secretary evaluation and pricing	Jumiah	3
Student payment submission	You	1.5
Finance verification	You	2.5
Secretary receipt check and handoff	Jumiah	1
Window 1 release	Ed	1
Student completion check	You	0.5
Admin dashboard and analytics	You	1.5
Admin accounts and verification	Ed	1.5
Admin maintenance and audit logs	Jumiah	1.5
Closing	You	0.5

Prepare before presenting

Open separate signed-in role tabs or browser profiles, complete staff OTP beforehand, and label the tabs Student, Window 1, Secretary, Finance and Admin. Rehearse on the version deployed for the defense.

Use an authorized demo student with a complete profile, Year Level, Section and required study years. Match the student’s college to Jumiah’s Secretary account. Choose one eligible paid document with no conflicting active request; prepare its required proof and an approved test payment image.

Check the Finance receipt pack and issuing hours. Prepare a separate already-issued receipt case if the demo may run at or after 4 PM Manila. Keep a completed reference case and a pending demo registration ready for the Admin segments.

Student request and Window 1 intake

Opening delivered by You

Say "We will follow one document request through the student, Window 1, College Secretary and Finance accounts. Each desk performs its own checks, while the student can see the request's progress. We will then show how Admin monitors records and manages the system."

Student request delivered by You

1. Open Student Dashboard. Briefly show History, Support and the profile. Confirm that the required student information is already saved.

2. Click New Request. In Select Documents, choose the prepared eligible document and show that the available choices come from the configured catalog. Click Next.

3. In Fill up details, enter the purpose, copies and any document-specific fields. Attach required proof. If a saved profile field is missing, complete the profile before continuing.

4. Click Next to Review. Point out the document, purpose and attachments. Click Confirm Request and acknowledge the result. Do not double-click a pending submission.

5. Copy the generated tracking number into your shared demo notes. Open Live Tracking and show the first stage. For a priced-later document, explain that the final amount is set after processing.

Say "The student files the request once and receives a tracking number. The request first goes to Window 1 for intake; it does not skip evaluation or payment checks."

Show before switching The new request is awaiting intake. Read the actual tracking number aloud.

Handoff You to Ed: "Ed will now open this same tracking number in the Window 1 intake queue."

Window 1 intake delivered by Ed

1. Open Workspace Dashboard and the Intake queue. Locate the same tracking number and open Intake Check.

2. Show the student, document type, assigned/current desk and available paperwork. Review required attachments and any supporting-document requirements. If paper was supplied, attach the approved scan through the available intake control.

3. Complete any required original-document acknowledgment and record an intake note if needed. Click Route to Secretary and confirm the decision.

4. Verify that the request leaves Intake and is awaiting College Secretary evaluation. If a list has not refreshed yet, use Refresh once.

Say "Window 1 checks that the request and supporting paperwork are ready. If something is missing, it can be returned with an explanation. For this complete case, I am routing it to the College Secretary."

Handoff Ed to Jumiah: "This request is now ready for the assigned college's evaluation."

Secretary evaluation and Student payment

College Secretary evaluation delivered by Jumiah

1. Open Dashboard and Initial Evaluation. Find the same tracking number and click Review.

2. Show the request summary, student purpose and student details. If a source scan is present, compare the extracted information against it; otherwise use the digital request evaluation. Correct only what is actually wrong.

3. Choose Ready By and enter an appropriate Secretary note. Click Accept for Processing, review the confirmation and confirm.

Say "The Secretary checks the student's request within the assigned college. Extracted text is reviewed against its source; OCR assists the review and does not replace the staff decision. Ready By is communicated separately from the final bill."

Processing and pricing delivered by Jumiah

4. Open Processing & Pricing and select Set Price for the same request. Use the prepared document output for the demonstration.

5. Enter actual printed pages where required and review the fee breakdown. Flat-fee documents use the saved fee schedule. Do not invent an amount or use years attended as a page count.

6. Save the price and confirm. For the final unpriced item in a request group, the action is Save & Bill Student. The main demo uses one document to keep this handoff clear.

Show before switching The final amount is saved and the request is waiting for student payment. Show or print the available Order of Payment if useful.

Say "The charge comes from the saved fee schedule and the actual output. The student is billed after processing, and a request group is billed when all its items have been priced."

Handoff Jumiah to You: "The amount is now available in the student account. The student can review it and submit payment details."

Student payment submission delivered by You

1. Return to the Student tab. Open the billed request's Pay action and verify the tracking number and total.

2. Show the payment breakdown and the selected enabled payment method. In the demonstration environment, use the approved test reference and proof. Submit and confirm through the displayed payment flow.

3. Show the payment-verification status. The uploaded image or reference alone does not mean Finance has approved the payment.

Say "The student sees the saved charge and submits the payment reference and proof. The request now waits for Finance to check the payment. The Order of Payment is a billing slip, not an Official Receipt."

Handoff You as Student to You as Finance: "I will now switch roles to show the independent Finance verification."

Finance verification and final release

Finance delivered by You

1. Open Finance Dashboard and its payment-verification queue. Find the same tracking number and open Verification Details.

2. Compare the student/payor, program, amount, payment reference and proof with the expected bill. Explain that unclear or incorrect payment details require review; rejection needs a note.

3. During eligible issuing hours, check the active receipt pack and next serial. Choose whether to attach the digital OR copy now or upload it later. Click Verify Payment, inspect the confirmation and confirm once.

4. Show the saved payment result and recorded OR. Print or preview the saved receipt when available. If the digital copy was deferred, show that its upload remains available in Payment History.

Say "Finance verifies the money details independently of the Secretary's academic checks. A new receipt number is issued only when the eligible payment verification is confirmed. Reprinting a saved receipt does not consume another serial."

Cutoff branch At or after 4 PM Manila, explain the displayed pending-issuance state. Payment clearance and OR issuance are separate. Do not claim an OR was issued if it was deferred. To continue the remaining demonstration, explicitly switch to the prepared issued-receipt case and announce its different tracking number.

Handoff You to Jumiah: "Finance has verified the payment. Jumiah will check the issued Official Receipt before handoff."

Secretary receipt check and handoff delivered by Jumiah

1. Open OR Verification and click Verify Receipt. Match the recorded OR number with the actual digital or physical receipt. Select the matching acknowledgment and click Confirm Receipt.

2. Open Final Handoff. After the prepared document is physically ready for Window 1, select Handed to Window 1 and confirm. Show that the request is ready for pickup.

Say "The Secretary's receipt inspection is a separate check from Finance approval. Final Handoff records that the prepared document is being passed to Window 1 for release."

Handoff Jumiah to Ed: "The document is ready at Window 1 for the student's pickup."

Release delivered by Ed and completion delivered by You

1. Ed opens Window 1 Release, locates the same case and opens the release action. Check the student and recorded OR, perform the normal pickup identity check, then confirm release.

2. You return to Student History or Dashboard. Open Live Tracking and show Completed with its saved history. Briefly show the notification if available; do not wait on email or SMS delivery.

Say "The completed status is recorded only after the release is confirmed. The student's history and the staff audit trail now show the finished request."

Handoff You: "We will now show the three Admin areas that support and monitor this workflow."

Admin split across the three presenters

Present the Admin session in three parts, about 90 seconds each. Show oversight and management after the operational workflow is complete. Keep detailed AI questions for pages 8-10.

Admin part one delivered by You

Scope Dashboard, Document Tracker and Efficiency Analytics.

1. Show saved backlog, measured throughput and scan-field detection. Field detection is not measured AI accuracy.

2. Find the completed case in Document Tracker and open its history.

3. Open Efficiency Analytics. Show Document Efficiency, measured waits, releases, workload and analysis. Briefly open Support Analytics and its reporting period.

4. Open AI & Model Evaluation. Show the dataset origin and prepared error comparison. Use the short script on page 8. On Dashboard, identify the displayed forecast method if asked.

Say "TRACE separates measured workflow data, forecast errors and OCR field detection. A synthetic backtest demonstrates evaluation; it does not prove accuracy on real PLP demand."

Handoff You to Ed: "Ed will explain how Admin controls which accounts can access these workflows."

Admin part two delivered by Ed

Scope Account Verification, Accounts and role permissions.

1. Open the prepared pending applicant from the dashboard. Show account type, Student ID, college/program and authorized proof.

2. Show the decision and recorded reason. Confirm only the intended demo decision; otherwise close the review.

3. Open System Maintenance and Accounts. Show roles, desk assignments, college scope and account controls. A Student ID cannot register separate active accounts.

Say "Automatic proof checks can require manual review. Admin records its decision, while desk and college permissions continue to control later actions."

Handoff Ed to Jumiah: "Jumiah will show how Admin maintains the rules and checks recorded activity."

Admin part three delivered by Jumiah

Scope System Maintenance, Activity Logs and Security Logs.

1. Show Document Types, saved fees and requirements, then Colleges and Programs if time permits. Open an edit form to explain it, then cancel.

2. Open Activity Logs. Find the demonstrated tracking number when present in loaded history and show staff, action and timestamp. The view loads the latest 100 events.

3. Open Security Logs to distinguish security events from workflow actions. Point out Reports & Export.

Say "Catalog rules and saved fees drive forms and billing. Event views are capped; their counts are separate from the total document rows in reports."

Support demonstration and rehearsal notes

Optional Support segment delivered by Ed

Use this instead of an extended Admin navigation tour if the panel asks about communication. Keep it to about one minute.

1. You open Student Support, select or create a prepared concern and send one short demonstration message. If it starts in FAQ assistance, choose Talk to staff only when live support is required.

2. During configured support hours, Ed opens Window 1 Support, declares availability if needed and confirms Claim oldest ticket. Claim follows queue order; prepare the demo queue beforehand rather than expecting any chosen ticket to be claimed.

3. Show the fixed conversation header. Hover over the i icon to identify linked-case information. For a linked ticket, open it and show the authorized case, then return to the conversation.

4. Show Conversation guidance below messages. When the concern is actually complete, use the Resolve ticket icon, confirm, and show the resolved conversation in Archive. Admin monitors operational support; Finance and Secretary retain their own permitted controls.

Say “Support preserves the conversation and its linked case. Resolving a ticket archives the conversation; it does not delete the request or mark the document released. Outside live hours, the displayed notice explains that the queue place is saved.”

If something interrupts the demonstration

Situation	Presenter response	Continue with
Next action is disabled	Read the missing requirement or status; do not skip it.	Complete the field or use the clearly identified prepared case.
Next desk cannot see the case	Check tracking number, saved college, current stage and ownership. Refresh once.	Correct the scope; do not create a duplicate request.
AI advice or forecast unavailable	Show the labelled unavailable or insufficient-history state.	Use the measured report tables; do not invent a chart.
OR issuance is deferred	Explain the 4 PM Manila rule and payment acknowledgment.	Announce the separate issued-receipt case.
Live claim is unavailable	Read the support-hours/availability message.	Show saved history or the prepared archived ticket.
Email or SMS is delayed	Show the saved in-app state and notification if present.	Proceed without claiming delivery was confirmed.

Panel questions and final checks

Short answers to likely panel questions

Why several checks? Window 1 checks intake, the Secretary checks academic processing and prices the output, Finance verifies payment, and Window 1 confirms final release. Each action has its own permission and stage.

Is all of this AI? OCR assists extraction and text checks; Prophet estimates incoming demand. Queue/report advice uses descriptive aggregate rules. Workflow transitions, billing constraints and authorization remain explicit system rules.

Can you prove AI accuracy? We can show held-out forecast errors and their dataset origin. Our synthetic backtest demonstrates evaluation, not real PLP accuracy. OCR field detection does not establish recognition accuracy. See pages 8-10 for explanations and sample answers.

Request milestones to check during rehearsal

After this action	Expected result
Student confirms request	Received and awaiting intake
Window 1 routes it	With the College Secretary
Secretary accepts it	Being processed
Secretary saves final bill	Payment required
Student submits payment details	Verifying payment
Finance clears payment	Paid with OR issued or explicitly pending
Secretary confirms OR inspection	Paid with final checks before release
Secretary confirms Final Handoff	Ready for pickup
Window 1 confirms release	Completed

Final rehearsal check Keep the tracking number ready, test each role handoff, confirm matching college scope, check receipt availability and use saved results to recover from an interrupted screen. Check that the AI tab is available on the actual demonstration version.

Closing delivered by You

Say "We have shown one request moving through intake, evaluation, pricing, payment verification and release, followed by the Admin records that monitor it. The student can track progress, staff decisions remain separated by role, and the system preserves the recorded history for review. Thank you; we are ready for your questions."

AI defense notes: what to show and say

Presenter: You. Use the short explanation during your Admin segment. Keep the worked example and detailed questions for the panel discussion. Updated October 18, 2026.

Before the defense

Confirm that the matching frontend/backend version includes **Efficiency Analytics > AI & Model Evaluation**. The new section was prepared locally; do not assume it is already on the deployed site. Rehearse with a saved result so a model fit does not consume demonstration time.

Where to click

1. Show the three Analytics tabs: **Document Efficiency**, **Support Analytics** and **AI & Model Evaluation**. They use the same Admin tab style.

2. In the AI tab, point to document totals, recognized synthetic rows and the recorded date range. Explain the difference between document rows and the latest-100 event views.

3. Show the prepared historical period and selected dataset. Identify the training dates, skipped current day, seven test dates and the Prophet/baseline comparison. Read the loaded scope, not a changed draft date.

4. Show **Why TRACE uses this**, **Compared with alternatives** and OCR measurement status. If evaluation is unavailable or insufficient, explain that state without inventing a score.

A short explanation you can rehearse

Say "TRACE uses EasyOCR to help extract text, Prophet to estimate daily incoming requests, and explicit workflow rules to summarize queues. We evaluate forecasts by training on earlier dates and comparing predictions with later recorded counts. MAE shows the average daily miss, RMSE gives large misses more weight, and WAPE expresses total absolute error relative to recorded demand. We compare Prophet with a simple weekday baseline. Synthetic results demonstrate the process; they do not establish real PLP accuracy. OCR field detection is also separate from correctness."

Why these approaches, rather than the alternatives?

Approach	A defensible explanation
EasyOCR	It provides pretrained text detection/recognition in our local Python/CPU pipeline. Tesseract and cloud OCR are alternatives; we have not shown EasyOCR is more accurate than them.
Prophet	It is a practical starting model for daily trend and weekly patterns. ARIMA/SARIMA, regression with lag features and neural models are alternatives. The baseline comparison checks whether Prophet adds value.
Workflow rules	Their suggestions can be traced to measured counts and desk policies. The earlier four-example Random Forest demonstration has been retired from active advice; current rules have no ML accuracy score.

Remember: Explain the design choice and the evidence separately. Do not claim that an alternative was beaten unless a comparable benchmark was actually performed.

AI measurements: plain language and a worked example

Start here: "A prediction error is the difference between the forecast and the recorded count. Lower MAE, RMSE and WAPE are better." The recorded count is what the database contains; complete real-world collection must still be verified.

Measurement	How to explain it	Unit
MAE Mean absolute error	On average, how many document requests did the forecast miss by each day?	Requests/day
RMSE Root mean squared error	How large were the mistakes, giving more weight to unusually large misses?	Requests/day
WAPE Weighted absolute percentage error	How large was the total absolute error compared with total recorded demand?	Percent error

A simple three-day example - illustrative, not a TRACE result

Day	Recorded	Predicted	Absolute error	Squared error
1	10	9	1	1
2	10	9	1	1
3	10	15	5	25
Total	**30**	**33**	**7**	**27**

MAE: (1 + 1 + 5) / 3 = **2.33 requests/day**. Say: "Across these days, we missed by about two to three requests per day on average."

RMSE: square root of [(1 + 1 + 25) / 3] = **3 requests/day**. The five-request miss has more influence because it is squared before averaging.

WAPE: 7 / 30 x 100 = **23.33% error**. Add the absolute daily errors first; overestimates and underestimates must not cancel each other out.

What is the baseline?

Say "The weekday baseline predicts demand from the average of earlier matching weekdays. For a future Monday, it uses earlier Mondays in the training period. It is a simple reference for checking whether Prophet provides an improvement." Both methods use the same training counts and test dates.

What does held-out mean?

Say "We fit the model using earlier dates, then score it against later counts it did not receive during fitting." TRACE also skips one simulated current day to match its live tomorrow-through-day-seven forecast horizon. The local archive test uses up to 90 training days and at least 28 calendar days with some recorded training demand.

Do not convert WAPE into a validated accuracy score. A WAPE of 20% does not establish "80% accuracy." WAPE can exceed 100%, and it is undefined when total recorded test demand is zero.

AI panel questions: the honest answers

Reference example only: These are results from a local, recognized synthetic archive checked on October 18, 2026. They are not production PLP accuracy. Use the loaded result if the dataset or period changes.

Period: train April 14-July 12, 2026 (90 calendar days, 393 requests); skip July 13; test July 14-20 (22 requests). The model receives no held-out actual counts.

Method	MAE	RMSE	WAPE
Prophet	2.57	2.98	81.82%
Weekday baseline	2.14	2.75	68.18%

Say "Prophet missed by about 2.57 requests per day, compared with 2.14 for the baseline. Using unrounded MAE, Prophet had 20% higher error in this test. We report that result transparently."

Why use Prophet if the baseline did better?

"We selected Prophet as a practical starting model for daily trend and weekly patterns. Evaluation checks that choice. This window does not establish an advantage; it supports further validation and tuning on representative, verified data." Do not say TRACE automatically chooses whichever model wins a backtest; that selection is not implemented.

Does this prove performance on actual PLP demand?

"No. Generated records let us demonstrate the evaluation process. Real-world predictive performance requires representative institutional history with verified origin, complete collection and repeated held-out evaluations." More records alone do not establish better data quality.

Why do reports show thousands of records but logs show 100?

"Reports count document rows; one document can have multiple workflow events. Activity and global Security Logs load the latest 100 events. That is a display limit, not the total number of document requests." The local snapshot had 10,032 document rows: 10,000 recognized mock rows and 32 unmarked rows. Unmarked does not automatically mean real.

Is the OCR field-detection score its accuracy?

"No. It is the share of expected fields detected. All fields may be found while their values are wrong. Recognition accuracy needs human-labeled correct values. We have not measured that accuracy for intake, registration checks or receipts." Software tests do not substitute for this evaluation.

What if they ask for one overall AI accuracy percentage?

"We do not combine these into one percentage. Forecasting, OCR and workflow advice perform different tasks and have different evidence. We show measured errors and explicitly label what remains unmeasured."

One sentence to remember: "Our measurements describe the evidence available, including its limitations; they do not guarantee future accuracy."
